Materials

- 8mm socket and ratchet, or flat head screw driver depending on truck year
- New assembly
- New reverse bulbs and brake light bulbs if replacing those as well

Step 1 - Out with the old

- Make sure the truck is off, the lights switched off, and all doors shut so that the rear lights are not on.
- Lower the tailgate.
- Remove the two bolts while supporting the taillight assembly in case it falls out.

Figure 1. Remove the two bolts.
• If the assembly doesn’t fall out, pull on it with the pressure distributed easily and it will pop out (be cautious not to pull too hard where you fall back and rip the wires out).
• Remove the bulbs. If using new bulbs, unclip the wiring harness from the bulb’s base and leave the old ones in the old assembly. If reusing the bulbs, hold the bulb by the base and turn it to unlock it from the housing, then pull it out paying careful attention not to touch the actual bulb glass.

**Step 2 - In with the new**

• Install the new bulb.
• Line up the assembly then push it in.
• Re-install the two bolts and tighten until snug. Don’t over tighten them.

Figure 2. Install the new assembly.
